

The Pharmacy Counter Is Broken.

Every day, patients are harmed by a system that relies on overworked humans for safety-critical checks.

THE PROBLEM

● Dispensing Errors Kill Patients

Wrong doses, wrong medications, missed contraindications. Medication errors cause **100,000+ deaths annually** in the US alone. Patients on 5+ medications face **30% higher error risk** — and overworked pharmacists are the only safety net.

● Drug Interactions Go Unchecked

A pharmacist handles 200+ prescriptions per day. Manual cross-checking of every pairwise interaction is humanly impossible at that volume. Dangerous combinations **slip through daily** — serotonin syndrome, bleeding risks, organ toxicity.

● Inventory Theft & Shrinkage

High-value medications — **insulin, opioids, specialty drugs** — disappear from pharmacy shelves. Internal theft by staff with direct access to controlled substances is an industry-wide problem that costs chains millions annually.

● Overstocking & Waste

Pharmacies overstock to avoid stockouts, tying up capital in expiring inventory. Without predictive demand signals, **billions in medications expire unused** each year across European pharmacy chains.

THE SOLUTION

The Fully Automated Pharmacy

AvatarAI replaces the error-prone human layer with an **end-to-end AI system** that handles prescription verification, drug interaction checking, dosage validation, inventory management, and dispensing — with zero or minimal staff on-site. Not an assistant for pharmacists. A replacement for the counter.

● AI Interaction Engine

Checks every pairwise drug interaction instantly against 300,000+ verified DDI records. Flags severity, explains mechanisms, suggests alternatives. In Slovak, with real trade names.

● Dosage Validation

Verifies prescribed doses against patient weight, age, renal function, and contraindications. Catches errors before they reach the patient — every time, not when a human happens to notice.

● Zero-Theft Architecture

Automated robotic dispensing with sealed inventory. No human hands touch high-value stock. Full chain-of-custody audit trail for every unit of insulin, every controlled substance.

● Predictive Inventory

AI demand forecasting per location. Auto-replenishment from warehouse. Eliminate overstocking and expiration waste. Reduce tied-up capital by 25-40%.

● Minimal Staffing

One trained attendant per location instead of 3-4 pharmacists. The system handles verification, the attendant handles human contact. Payroll savings: 60-70% per location.

● Scalable Across Markets

Localized drug databases map to any national register (SUKL SK, SUKL CZ, GIF PL, ANMDM RO). One platform, 17 countries, 3,200+ Dr.Max locations.

WHY DR.MAX

Europe's #2 pharmacy chain

3,200 locations, 17 countries, \$5.1B revenue. The scale to make full automation viable.

Digitalization already underway

VusionGroup for store digitalization, Brightpick for robotic warehouse. AvatarAI is the missing layer.

Regulatory positioning

Clinical decision support — not a medical device. Avoids EU MDR classification. Deploy immediately.

01 Executive Demo

Live walkthrough with your pharmacy operations leadership.

02 Pilot Deployment

5-10 Dr.Max locations in Slovakia. Measure impact on safety and cost.

03 Enterprise Rollout

Full integration with Dr.Max systems. Scale across all 17 markets.
